

# Module Installation

## 1. Installing modules

A list of all installable modules (depending on the registered licence) can be found in the openITCOCKPIT front end under "Administration / Package Manager".

To install a module, simply click on the Install button for the given module. This will open a light box, install the corresponding module and display information about the steps to be performed..

**ATTENTION**

In older versions of openITCOCKPIT < 3.0.10-7 the openitcockpit-update command must be executed from the console after a module has been installed.

Installing modules often includes new rights for openITCOCKPIT users. These rights must be activated for the desired role under "Administration / Manage User Roles" for the module to be usable.

## 2. Module list

- check\_nrpe
- Auto report
- CheckMK
- Distribute (satellite)
- Maps
- Idoit
- Event correlation
